

SMARTER. SMALLER. STRONGER.

POWERROLL A-SERIES (PAPER)

Our popular air operated A-Series roll pusher is the most reliable, dependable and compact roll pusher available for the paper industry. The A-Series is rated to push up to 32,500 pounds at a variety of speeds, but most importantly, designed to operate easily with high load applications and heavy duty cycle capability with no rest periods. The A-Series is more heavy duty, requires less maintenance, and is easier to operate than our competitor's models.

Why choose the PowerRoll A-Series:

The A-Series features a heavy duty, welded main chassis that is in a true box layout. It is reinforced and chrome plated for increased strength and integrity as compared to the traditional bolted together design of our competitors. Plus, the A-Series features much larger rear wheels for increased maneuverability for the operator versus the smaller diameter wheels.

The A-Series features our patented Direct Drive System. The Direct Drive System encloses and protects the entire motor and gearbox system within the large drive roller. The Direct Drive System improves reliability, durability, and dramatically reduces maintenance costs over conventional chain and sprocket drive systems.

The A-Series can be equipped with two different handle configurations; Center, and Swivel/Pivot. The Swivel/Pivot configuration enables the handle to swivel from left to right in order to separate rolls and to pivot forward and backward. This allows for the operator to "pull" a paper roll, and not just push. The Swivel/Pivot handle greatly increases the machine's ergonomics and practical use for the operator versus a simple straight or center handle.

Configurable to Suit Each Application

Three gearing options (hi-speed ... hi-torque).
Three handle versions (SP, CF).
